

# SHUT IT!

This door has a known bug: if not released with enough distance, the automatic closure mechanism will sometimes not properly close and lock the door. This is a security issue.

The white box above the door is an alarm: if the door is open for longer than 30 seconds, it will start beeping.

*Emergency Shutdown: Pull out the sensor wire to power off the alarm.*

This Arduino project was built by @epplkrs.
